

Types of Validity Calculations in the Diagnostic Job-Fit Context

Validity **shows how well a diagnostic procedure actually predicts job fit and performance**. In person-job-fit diagnostics (e.g., PEP, tests, interviews, assessment centers), it is demonstrated through various types of evidence according to AERA and UGESP standards. The foundation consists of **statistical relationships (correlation coefficients)** between test scores and job criteria; values above $r > 0.30$ are considered practically relevant.

Main Types of Validity

1. Kriteriumsbezogene Validität

Misst den Zusammenhang zwischen Testergebnissen und realer Job-Leistung.

- **Predictive Validity:** Test administered before hiring, performance measured after 6–18 months. This provides the strongest predictive power ($r \approx 0.4\text{--}0.5$) and is regarded as the most legally robust evidence.
- **Concurrent Validity:** Test and performance data collected simultaneously from current employees — faster to obtain, but less prognostic.

2. Content-Related Validity

Evaluates whether the test tasks represent the job content. Based on job analyses and expert ratings (Content Validity Ratio > 0.7). Important for occupation-specific diagnostics.

3. Construct-Related Validity

Examines whether a procedure measures the intended theoretical construct (e.g., job fit, resilience, motivation). Demonstrated through factor analyses or regression models ($r \approx 0.2\text{--}0.4$). Subtypes:

Convergent Validity — correlation with similar tests (e.g., PEP and Big Five).

Discriminant Validity — differentiation from dissimilar characteristics.

Incremental Validity — additional explanatory value beyond other predictors.

4. Face Validity

Subjective impression of whether a test “appears meaningful.” Not a statistical measure, but important for acceptance and candidate experience.

Significance and Ranking

A solid validation combines all types into an overall demonstration of construct validity. In the practical job-fit context, the following ranking emerges based on predictive power and usefulness:

1. **Predictive validity** — highest value, direct forecast of later performance.
2. **Concurrent validity** — valuable for calibrating existing procedures.
3. **Content-related validity** — ensures job relevance and practical applicability.
4. **Construct-related validity** — strengthens theoretical foundation.
5. **Face validity** — supplementary for acceptance.

Predictive Validity (r)

Studie All studies on validity have shown exceptionally high correlations between the PEP overall score and indicators of professional success.

Hiring managers evaluate the new hires using a questionnaire with 20 statements (green) and several additional questions (blue) after 6 and 18 months.

15	Insgesamt kann ich sagen, dass das Team / die Abteilung / die Firma durch "NEWHIRED" verstärkt worden ist. 1. Hat "NEWHIRED" für die Stelle relevante Kenntnisse und / oder Fähigkeiten, die andere Ihrer Mitarbeitenden (mit gleicher / ähnlicher Funktion) nicht oder nicht so ausgeprägt / nicht so gut haben / nicht so gut können? A) Wenn ja, welche? B) Wenn nein, was fehlt? 2. Beschreiben Sie "NEWHIRED" bitte in 3 bis 5 treffenden Worten / Adjektiven:					36	1'5"	94	6	0
16	Ich erwarte, dass sich "NEWHIRED" bald zu einem wichtigen Leistungsträger (bessere 50%) oder gar zu einem Top-Performer (Beste 25%) entwickelt. 1. Welche besonderen Kenntnisse, Fähigkeiten und / oder Eigenschaften hat "NEWHIRED"? 2. Auf einer Skala von 0 bis 10: Wie gut ist "NEWHIRED" bereits? 3. Welche Note geben Sie Ihrem leistungsschwächsten und Ihrem leistungsstärksten Mitarbeiter?					36	1'14"	83	11	6
17	Sich für "NEWHIRED" zu entscheiden war eine sehr gute Entscheidung: Jedenfalls hat "NEWHIRED" bisher die Hoffnungen und Erwartungen voll gut erfüllt oder teilweise sogar übertroffen. Was ist das Besondere an "NEWHIRED", das "NEWHIRED" von den anderen Mitarbeitenden unterscheidet? 1. Im Positiven? 2. Im Negativen?					36	0'33"	86	11	3

Why is the predictive validity of the Talent Recruiter and Talent Developer so high?

In the early 1990s, IMDE began investigating peak performance. The best managers, project leaders, subject matter experts, and salespeople were observed in detail with the goal of identifying which self-concepts, attitudes, abilities, and behaviors in professionally success-relevant situations make the difference between the “winners” and the less effective and less successful individuals.

(Logical Levels by Robert Dilts)

Based on numerous modeling studies — with more added every year — master models have been developed for each functional group (image below).

The master model describes the critical incidents, i.e., what particularly effective and successful individuals do, or do not do, or do differently, compared to the less effective and less successful members of that functional group

By answering job-related questionnaires, participants declare to what extent statements apply to them in their opinion. From this, the **Potential Evaluation Program (PEP)** calculates the results for the specific applications (e.g., **Lean Recruiting, Talent Recruiter, Talent Developer, or Talent Manager**). It presents these results in relation to the master model (qualitative description) and as a comparison to the respective norm group (N > 5000) in scale values from 1 to 7.

Content-Related Validity

The success factors of the PEP Talent Recruiter are derived from practice and are therefore appropriate for the respective job.

Example: Subject Matter Experts II — predominantly white-collar jobs with higher education.

Content-Related Validity

PEP Management and PEP Sales correlate at $r = 0.733$, $N = 14$

Content-Related Validity

The success factors of the PEP Talent Recruiter are derived from practice and are therefore appropriate for the respective job.

This is essentially what sales management expects from salespeople.
And: A little more closing strength (6.3.) would be even better. Right?
